

CLEAN VERSION OF ABSTRACT

--A reproducing apparatus comprises a reproduction unit adapted to reproduce one or more moving image data from a recording medium, and a control unit adapted to control the reproduction unit using program information indicating a reproducing procedure of the one or more moving image data. The control unit (a) determines one or more parts to be deleted from the one or more moving image data using the program information and a non-reproduction period of each moving image data, (b) controls to delete the one or more parts determined by the control unit from the one or more moving image data, and (c) changes the program information according to one or more non-deleted parts of the one or more moving image data after the one or more parts determined by the control unit are deleted from the one or more moving image data.--
